

# LAB 4 – VIBECODING

Dino Run – Chat / LLM History

**Name:** Ramalakshmi M N

**SRN:** PES1UG24AM219

**LLM used:** ChatGPT

**Repository:** Ramalakshmi-1205/36\_dinoRun

## About this document

This is my ChatGPT working history for Lab 4. I used ChatGPT to understand the Dino Run README, fix the broken code, add the three features one by one, test them, and complete the GitHub work. I have kept the explanations short and in the order in which I completed the work.

## 1. Starting the project

I first forked the assigned Dino Run repository to my GitHub account and cloned it on my Windows laptop. I opened the project and ran the original game before changing anything.

### My prompt:

I have this Dino Run VibeCoding lab. Tell me what I need to do and guide me step by step because I am a beginner.

### ChatGPT guidance:

The main steps were to read the README, clone/fork the repository, run the original Python game, record the 10-second BEFORE video, fix the broken code, add the three features one by one, make separate Git commits, push to my personal repository, and finally record the AFTER video.

**What I did:** The original game ran successfully and I recorded my BEFORE video before making changes.

## 2. Task 1 – Fixing the High Score Bug

### My prompt:

The README says there is one deliberate bug in the high score. Can you tell me what is wrong and what exactly I should change?

### ChatGPT guidance:

The comparison in the collision code was backwards. The current run score should only replace the saved high score when the current score is greater.

### Original code:

```
        if self.high_score > current:
self.high_score = current
save_high_score(self.high_score)
```

### changed it to:

```
        if current > self.high_score:
            self.high_score = current
            save_high_score(self.high_score)
```

**Testing:** I ran the game and checked that the high-score change worked. Then I committed and pushed the change. I did not add the generated dino\_highscore.txt file to Git.

**Commit message:** Fix high score update bug

### 3. Task 2 – Dino Jump Tint

#### My prompt:

Now tell me how to implement the dino\_tint feature from the README. I want the Dino to look different when it is jumping.

#### ChatGPT guidance:

The function receives on\_ground as a Boolean. It can return None when the Dino is on the ground and an RGB color when the Dino is in the air. The existing draw code already uses the returned color.

#### Code I used:

```
def
dino_tint(on_ground):
    if on_ground:
        return None    return
(255, 165, 0)
```

**Testing:** On the ground the Dino stayed green, and while jumping it became orange. After testing, I committed and pushed the change.

**Commit message:** Add dino jump tint

## 4. Task 3 – Obstacle Passed Popup

### My prompt:

Now help me implement `on_obstacle_passed`. I want a simple feature that shows something when I successfully pass an obstacle.

### ChatGPT guidance:

A simple +1 popup can be used. The callback returns "+1". The game stores the returned text and shows it for a short time above the Dino.

### Function I used:

```
def on_obstacle_passed(obstacle, score):    """Called once, the frame an
obstacle finishes scrolling past the dino."""    return "+1"
```

### Other changes suggested by ChatGPT:

```
# In Game.reset()
self.popup_text = ""
self.popup_timer = 0

# When an obstacle passes if not obs.passed and
obs.rect.right < self.dino.rect.left:
    obs.passed = True    self.popup_text =
on_obstacle_passed(obs, self.score // 10)
self.popup_timer = 30

# Draw the popup
if
self.popup_text:
    popup_surf = self.font.render(self.popup_text, True, (0, 150,
0))    screen.blit(popup_surf, (self.dino.rect.x,
self.dino.rect.y - 30))
```

**Testing:** I ran the game and checked the obstacle-passed popup. The feature worked, and I pushed the updated code.

## 5. Task 4 – Double Jump

### My prompt: Task 4

ChatGPT explained that `max_jumps()` controls how many jumps the Dino can make before landing. For a double jump, it should return 2.

### Code I used:

```
def max_jumps():    """Return how many jumps the dino gets before it
must land again."""    return 2
```

**Testing:** I ran `python game.py`, pressed Space to jump, and pressed Space again while the Dino was still in the air. The Dino successfully performed two jumps, so the feature worked.

**Commit message:** Add double jump

## 6. GitHub / Version Control Work

For the lab, I kept separate commits for the tasks and pushed the updated code to my personal GitHub repository. I did not create a pull request to the SETAPESU26 main repository.

```
git add game.py git commit -m "Fix high
score update bug" git push
```

```
git add game.py git commit -m
"Add dino jump tint" git push
```

```
git add game.py git commit -m
"Add double jump" git push
```

The obstacle-popup change was also committed and pushed as part of the Task 3 work. The generated dino\_highscore.txt file was intentionally not included in the commits.

## 7. Final Video

**BEFORE video:** PES1UG24AM219\_DinoRun\_Before.mp4

**AFTER video:** PES1UG24AM219\_DinoRun\_After.mp4

I recorded the BEFORE video before making changes and the AFTER video after completing and testing all four tasks.
